

Proposed New Trend Visualizer

Historical reading (of last 60 seconds)

Instantaneous reading

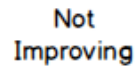

The proposal above replaces the "half circle gauge" part of our current presentation. The "2 minute count down to failure due to bad trend" part will still need to be retained.

Instead of an analog instantaneous reading, have 5 discreet states:

Improving (a lot)
Improving (a little)
Not improving (a little)
Not improving (a lot)

and in case of "Not improving", but LOR is above Trend Threshold, then display as:

Noisy

Standard Flat-Line Trend Analysis

Inflow Flat-Line Trend Analysis

Trend state transformation:

Point-wise min
Re-scale to [-1. 1] range

Translate to discreet
state : Very Good, Good,
Noise, Bad, Very Bad

Trend state transformation:

Point-wise min/max
Re-scale to [-1. 1] range

Translate to discreet
state : Very Good, Good,
Noise, Bad, Very Bad

New algorithm proposed by R&D

Trend visualization
